"Influence of Chromium and Nickel on Martensite Conversion During Deformation and the Mechanical Properties of Fe-Ni-Cr Alloys"

Sverdlovsk, Fizika Metallov i Metallovedeniye, Vol 31, No 3, Mar 71, pp 574-577

Abstract: In Fe-Ni and Fe-Ni-Cr alloys, a decrease in the content of nickel and an increase in the content of chromium cause activation of the martensitic conversion during deformation. It is assumed that activation of the conversion is related to packing defects which develop during deformation and serve as seeds of the martensite.

"Effect of Chromium on Phase Transformations and Strengthening of Type G13
and 30G10 Steels"

Sverdlovsk, Fizika Metallov i Metallovedeniye, Vol 30, No 6, Dec 70, pp 1213-
1220

Abstract: A study was made of the effect of chromium (up to 16%) on the phase composition, martensite points, phase transformations, and strengthening during plastic deformation of unstable alloys (G13 and 30G10) which form both alpha- and epsilon-martensite. The steels were melted in an induction furnace and poured as blanks weighing 8 kg which were homogenized at 1200° C for 10 hours. After heat treating, the blanks were forged into rods which were austenitized at 1100° C (G13) and 1150° C (30G10) with subsequent water cooling. It was found that adding up to 16% Cr to 30G10 carbon steel significantly reduces the alpha-M_s point and degree of gamma-alpha transformation during cooling. Increased Cr content lowers the epsilon-M_s point and degree of gamma-epsilon transformation for both types of alloys. With a Cr content up to 16% in the 30G10 unstable austenitic

steel, the resistance of austenite to formation of alpha-martensite is increased under deformation. Stability of austenite to formation of epsilon-martensite varies in a more complex relationship. An increase in Cr content to 16% in steel G13, the structure of which is epsilon \rightarrow alpha + gamma in the hardened state, leads to a lowering of the intensity of alpha-martensite formation and the intensity of the epsilon-phase under plastic deformation. In the investigated steels a transformation develops under deformation by the system gamma + epsilon \rightarrow alpha. The increase in Cr content affects development of each of these types of transformations and, consequently, affects the ratio of phases formed as a result of plastic deformation.

101609x Properties of rubbers from SKMS-30 ARKM-15 modified with plastic materials. Tyurina, V. S.; Shvarts, A. G.; Eitingon, I. I. (Nauch.-Issled. Inst. Shin. Prom., Moscow, USSR). *Kauch. Rezina* 1970, 29(1), 8-10 (Russ). The physico-mech. properties of SKMS-30 ARKM-15 (I) vulcanizates contg. 3-12% butadiene-styrene copolymer (Marbon 8000A), high-pressure polyethylene, low-pressure polyethylene (II), ethylene-propylene copolymer (III), isotactic polypropylene (IV), polyamide copolymer 548 (V), and poly(vinyl chloride) and the processability of carbon black-filled I mixts. were studied. Introduction of II, IV, and V to carbon black-filled I mixts. brought about a substantial increase in viscosity, tear strength, and 100% modulus, and reduced creep at high temps. III increased the values of all these properties. The reinforcing effect of II and IV in unfilled rubber depended on the m.p. of the cryst. phase and the vulcanization temp. Elastomers obtained at a temp. below the m.p. of the plastics exhibited superior 100% modulus, tensile strength, and tear strength.

"Effect of Meturin on Processes of Oxygen Liberation in Photosynthesis"

V sb. Khim. sredstva zashchity rast. (Chemical Agents for Plant Protection -- collection of Works), vyp 1, Moscow, 1970, pp 191-194 (from RZh-Khimiya, No 11, Jun 72, Abstract No 11N447)

Translation: In experiments with chloroplasts isolated from young oat plants treated through the roots with meturin (I) (N-phenyl-N-hydroxy-N'-methylurea), the Hill reaction was inhibited. In this respect compound I was no different from monurone. In experiments with direct introduction of the herbicide into a mixture containing photolytically active chloroplasts from the leaves of peas, compound I and four other N-aryl-N-hydroxy-N'-methylureas, in contrast to phenurone and monurone, caused practically no inhibition of the Hill process. It is possible that I in plants is converted to compounds which inhibit photolytic activity of chloroplasts.

"Vascular Changes in Some Endocrine Glands After Experimental Burn Shock"

Leningrad, Arkhiv Anatomii, Gistologii i Embriologii, No 10, 1971, pp 5-12

Abstract: The blood vessels of the adrenal and thyroid glands and gonads in dogs were examined after the animals were subjected to burns covering 20 to 25% of the body surface. The vascular system of the glands reacted to the burn within hours in the form of severe circulatory disturbances, hyperemia in particular. The arterial bed expanded due to enlargement of the diameter of the arteries and appearance of numerous accessory connecting branches which are collapsed at the ordinary level of functioning. The venous and lymph beds also expanded as a result of dilatation of all the elements from capillaries to large trunks. Venous and capillary stasis and thrombi in the large veins were common. Hemorrhages were fairly frequent. The vascular response to the trauma was most pronounced in the adrenals and thyroid. There were some indications of increased thyroid function and decreased generative function of the ovaries and testes.

"Optimization of the Structure of Generating Facilities in the Planning of Combined Power Systems"

Tr. Mosk. Energ. In-ta [Works of Moscow Institute of Power Engineering], 1972, No 109, 159-169 (Translated from Referativnyy Zhurnal Elektrotekhnika i Energetika, No 9, 1972, Abstract No 9Yel03, by V. S. Emma)

Translation: A mathematical model is suggested for determination of the optimal structure of the generating facilities of a power system with fixed external connections for a five-year period. Simplified indicators are fixed for load graphs, as well as the basic technical and economic characteristics of existing power systems, power systems under construction and new power systems. The criterion for optimization is the minimum adjusted calculated expenditures for the power system and fuel for the calculation period, while observing the conditions of coverage of the balance of capacity and power production. The optimal composition of power system equipment and the number of hours of utilization of the capacity of power plants of each type are determined for each design year. The following types of power plants are used in the optimization calculations: gas turbine units, pumped-storage power plants, nuclear power plants and modular condensation power plants. "Centralization and Decentralization in Computer Systems"

Tr. In-ta elektron. upravl. mashin (Works of the Institute of Control Computers), 1972, vyp. 17, pp 13-26 (from RZh-Kibernetika, No 5, May 73, abstract No 5V781 by V. Ostrovskiy)

Translation: The paper deals with methods of organizing multi-computer systems to achieve reciprocally matched actions and operation of all computers in the system as a unit. A necessary condition for integrated operation of the system is exchange of information between individual computers relative to the problem being solved and the structure of the system. This paper classifies the set of possible messages which may be exchanged by the computers. Six modes of operation of a computer within the system are distinguished depending on the diversity of generated and required messages. Then on the basis of the modes in which the computers of the system have been set and the nature of data exchange between them, com-

puter systems are classified with respect to centralization and decentralization of the computational process. The possible levels of organization of the system range from absolutely centralized to absolutely decentralized systems. Noting the advantages and disadvantages of each method of organization, the author calls attention to the fact that the problem of choosing the optimum level of centralization has as yet been neither formulated nor solved. He then offers two modifications of a decentralized computer system which can be considered intermediate between absolutely centralized and absolutely decentralized systems as regards method of organization. In conclusion it is suggested that it is just such systems (in which only part of the functions are centralized) which will best meet the criteria for operation encountered in practice.

Dokl. Vses. nauchno-tekhn. konferentsii po radiotekhn. izmereniyam. T. 3
(Proceedings Of The All-Union Scientific-Technical Conference On Radio Engineering Measurements. Vol. 3), Novosibirsk, 1970, pp 73-74 (from RZh--Elektronika i yeye primeneniye, No 2, February 1971, Abstract No 2B508)

Translation: A device is described for measurement of the noise factor and the spectral density of noise of semiconductor devices in the range of infralow frequencies (ILF). A block diagram is presented of a receiving device. The ILF signal, modulated with respect to amplitude by the noise voltage, is recorded on a magnetic tape. Reproduction at a speed n times as great makes it possible to increase by n times the frequency of the spectrum being measured. The results are presented of measurements of the noise factor of a Type 1T308 transistor with various coverings [pokrytiye]. 2 ill. 2 ref. V.S.

ABSTRACT. THE STUDY WAS MADE OF THE ISOLATED PREPARATION OF THE STRETCH RECEPTOR OF THE MOULTING CRAYFISH.

INTRACELLULAR RECORDS WERE TAKEN FROM THE SOMA OF THE FAST ADAPTING (FA) OR SLOWLY ADAPTING (SA) NEURONS AND EXTRACELLULAR ONES, FROM THE NERVE TRUNK. DURING PROLONGED ACTION POTENTIALS (PAP) IN BOTH THE FA AND SA NEURONS THE ACTIVITY INCREASED. THE RESULTS WERE SIMILAR FOR PAP

CREATED BY MEANS OF STRYCHNINE OR NOVOCAIN APPLICATION OR THE DAMAGE OF THE SOMA MEMBRANE AND EVOKED ORTHODROMICALLY AS WELL AS ANTIDROMICALLY. IN CASE OF APPROXIMATELY EQUAL FREQUENCY OF SA AND FA NEURONS ACTIVITY,

AFTER THE PERIOD OF ITS INCREASE IN THE LATTER DURING THE SA NEURON PAP PLATEAU, THEIR DISCHARGES BECAME ABSOLUTELY SYNCHRONIZED. PAP OF ONE NEURON AND ONE OR SEVERAL IMPULSES OF THE OTHER CELL AS WELL AS PAP OF

BOTH ENURONS MAY BE SYNCHRONIZED. THE EFFECTS DESCRIBED ARE SUPPOSED TO BE DUE TO THE ELECTRIC FIELD PRODUCED DURING PAP. THE SIGNIFICANCE OF THE SYNCHRONIZING ELECTRIC FIELD ACTION FOR THE EPILEPTOGENIC FOCUS

NEURONS BEING AT A SIMILAR FUNCTION STATE IS DISCUSSED IN CONNECTION WITH THE OBTAINED RESULTS. FACILITY: INSTITUTE OF HIGHER NERVOUS ACTIVITY AND NEUROPHYSIOLOGY. FACILITY: ACADEMY OF

"Plasma-Arc Cutting in Sea Water"

Moscow, Svarochnoye Proizvodstvo, No 6, Jun 73, pp 52-53

Abstract: The authors determine the requirements for a plasma cutting torch which can work in sea water. A cutting torch is tested which can ensure the reliable parting of hull grades of steel up to 40mm thick in sea water with a salinity of 20 percent at a depth of 10m. The cutting is done at a current of 500-520amp and an arc voltage of 120-140v. The cutting rate of the plasma-arc is 2-5 times greater and the productivity is 3-8.5 times greater than is the case with electro-oxygen cutting.

"How High-Speed Processes are Studied"

Moscow, Priroda, No 3, Mar 73, pp 37-47

Abstract: The author discusses the basic principle of new optical methods of investigating high-speed processes by using ultrafast high-intensity light pulses. It is shown how the relation between anisotropy relaxation time and the width of a spectral line can be used as an indirect standard of comparison for measuring times on the order of 10^{-13} .. 10^{-14} sec and shorter. The disadvantages of this method are pointed out. The new direct measurement methods which overcome the disadvantages of the indirect method are subdivided into two types: 1. those in which two crossed or parallel light pulses are used one of which induces the effect to be studied, while the other acts as a measurement probe; 2. those in which an intense light pulse induces the Kerr effect in a cell to create an ultrafast shutter. The applications and limitations of various modifications of these methods are examined.

"New Optical Methods of Studying High-Speed Processes"

Moscow, Uspekhi Fizicheskikh Nauk, Vol. 104, No 1, May 71, pp 77-94

Abstract: New methods of the direct measurement of time and the study of the kinetics of high-speed processes in the nanosecond and picosecond range that have been developed in the last 2-3 years are surveyed. The new methods are divided into two types: (1) methods in which two crossed or colinear light pulses are used, one of which is intense and causes the phenomenon to be studied and the other of which is a weak pulse of the same or different duration and wavelength and serves as a probe of the phenomenon at different times in its development; (2) a method in which two light pulses are also used, where the intense pulse causes a high-frequency Kerr effect in a cell (for example, with carbon bisulfide) and if this pulse is short (for example, of picosecond duration), it creates a superfast optical shutter; the weak pulse, which can also be of the same or different wavelength and duration, can carry information on rapidly developing phenomena and be recorded at different phases of the development of the phenomenon by picosecond exposures. Requirements on

pp 77-94

the intensity of the low-power beam are only that the phenomenon can be recorded during the exposure time and that the light not cause nonlinear effects. The new methods are applied for studying and measuring such phenomena as the time of radiationless transitions, the time of illumination and restoration of absorption in saturating solutions, the time of fluorescence damping, the lifetime of phonons in crystals at various temperatures, and the kinetics of the development of a plasma arising in a focused pulse of intense light.

"Determining the Velocity and Absorption of Hypersound in Viscous Liquids
From Scattered-Light Spectra"

Moscow, Zhurnal Eksperimental'noy i Teoreticheskoy Fiziki, Vol 60, No 1,
1971, pp 146-159

Abstract: Using gas lasers, either with an Ne-He mixture, $\lambda = 6328 \text{ \AA}$ (40 mw), or a He-Cd¹¹⁴ mixture, $\lambda = 4416 \text{ \AA}$ (20 mw), and working in a multimode operation to excite scattered light, the authors experimentally studied the fine structure of the extremities of the Rayleigh line in salol and benzophenone, with the viscosities varying by many orders of magnitude. The phenomenon of the fine structure of the extremities of the Rayleigh line results from the fact that a doublet is observed in the spectra of depolarized scattered light under specific conditions. The velocity and absorptivity of longitudinal hypersound were determined in salol, benzophenone, and triacetate over a broad viscosity range. Two branches of transverse hypersound oscillations in liquids were observed -- low temperature ("normal"), 1/2

USSR

SABIROV, L. M., et al, Zhurnal Eksperimental'noy i Teoreticheskoy Fiziki, Vol 60, No 1, 1971, pp 146-159

in which the transverse components in the scattered-light spectra are shifted with decrease in temperature, and the high-temperature ("anomalous") branch, in which these components draw closer together with temperature decrease. The temperature range used was -65 to $+137^{\circ}$ C. The theory that the scattering of anisotropy fluctuations is characterized by two relaxation times most fully explains the experimental findings.

"Interaction of Light and Sound"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya, May 1971, pp 874-882

Abstract: A short review of the interaction of light with longitudinal and transverse hypersonic waves in thermal and Mandelstam-Brillouin scattering is given. Questions of the conversion of the energy of two intensive light beams, different in frequency, into the energy of a sound wave are considered. The conversion of short pulses of light into sound energy of hypersonic frequencies is considered briefly.

The article includes 10 equations and 3 figures. Figure 1 shows the curve for the dependence of α/f^2 on the frequency f in benzene. Figure 2 shows the curve for the dependence of the speed of ultrasound and hypersound in triacetin. Figure 3 shows the curve for the dependence of the distance between components of a "transverse" $2\Delta_{\text{max}}$ doublet on temperature in Salol.

"Frequency Meter"

USSR Author's Certificate No 251029, Filed 20 Aug 66, Published 11 Feb 70 (from
RZh-Radiotekhnika, No 8, Aug 70, Abstract No 8A385 P)

Translation: This author's certificate introduces a frequency meter containing a pulse counter connected via a switch to the inputs of the standard and measured frequency meter. The frequency meter is distinguished by the fact that uniqueness of the reading is insured in it with a multiple ratio of the standard and measured frequencies. For this purpose, a frequency divider is included between the input of the measured frequency meter and the switching device. An auxiliary pulse counter with a capacitance equal to the division coefficient of the frequency divider is connected to the input of the pulse counter. Before the measurement, the auxiliary pulse counter is set to a number equal to half of its capacity.

STUDY OF COLLISIONS OF MACHINE ELEMENTS ON THE BASIS OF PHENOMENOLOGICAL MODELS OF ELASTIC MEDIA

A. N. Lenskiy, V. M. Loboda and L. P. Fabrika (Dnepropetrovsk)

The experience gained in application of analog models for determination of the force modes of operation of elements of heavy machines in the mining and metallurgical industry is discussed. The general problems involved in the statement and solution of the problem of determining impact parameters (duration, magnitude and form of impact pulse, impact energy, coefficient of restitution), as well as problems of determining the dynamic results of impact loads between the elastic links of machines resulting from impact interaction of masses are presented. A method is described for determining areas of stability of periodic modes of motion of impact and vibration-impact systems using analog models.

A generalized model for substitution of an elementary volume of a medium is suggested. The colliding bodies are considered as consisting of a set of elementary volumes. Each elementary volume and its coupling to neighboring volumes are replaced by a mechanical model, the properties of which are determined by the properties of the material of the colliding bodies. Phenological models of viscoelastic, elastoplastic and viscoelastoplastic media are studied. It is demonstrated that these models describe the properties of structural materials used in machine building sufficiently completely for purposes of modeling of collisions).

The characteristics of the substitution models are calculated or determined on the basis of results of static and dynamic tests of materials.

The mathematical models suggested describe the collisions of bodies, the period of natural oscillations of which is short in comparison to the duration of the collisions. The use of the models suggested for the study of collisions of machine elements is justified.

Examples are presented of modeling concrete impact and vibration-impact systems: a vertical vibration transporter, an unbalanced rotor, rotating in a bearing without lubrication, and a Geneva mechanism. The results of modeling are compared with precise analytic solutions.

"Closed Solution of a Two-Dimensional Integral Equation"

Kazan', Izvestiya Vysshikh Uchyebykh Zavedeniy, Matematika,
No 2, Feb 71, pp 102-104

Abstract: In this article a special procedure is used to obtain the exact solution in closed form for an integral equation of the type

$$\int_0^a \int_0^{2\pi} \frac{F(\rho_0, \phi_0) \rho_0 d\rho_0 d\phi_0}{[\rho^2 + \rho_0^2 - 2\rho\rho_0 \cos(\phi - \phi_0)]^{(1+\nu)/2}} = f(\rho, \phi) \quad (0 \leq \rho \leq a, 0 \leq \phi \leq 2\pi),$$

where $0 < \nu < 1$ and $f(\rho, \phi)$ is a given function. Abelian and L-operators, by means of which the solution can be simplified, are introduced. The example of an inclined circular punch with a flat base in an inhomogeneous half space is considered.

"Measuring the Lifetime of KrII Levels by the Methods of Electron Optical Chronography"

Leningrad, Optika i Spektroskopiya, Vol XXXIV, No 4, 1973, pp 645-649

Abstract: Results are presented from measuring the lifetime of KrII levels in the nanosecond range by the method of electron optical chronography. The experimental setup is described, and an error analysis is made. The measurement conditions are as follows: duration of the exciting electron beam $5 \cdot 10^{-9}$ seconds, cutoff time $\tau_c = 1.5 \cdot 10^{-9}$ seconds, current density per pulse $j_u = 2$ milliamps/cm², krypton pressure in the electron tube $4 \cdot 10^{-3}$ torr. A standard image converter tube recording of the weak line obtained in the single fire mode is presented. The measurement results are tabulated. An increase in the current density j_u to 15 milliamps/cm² and the pressure to $4 \cdot 10^{-2}$ torr has no effect on the measured value of τ . The intensity of the spectral lines in this case depends linearly on the given parameters, indicating the absence of quenching collisions. Variation of the energy of the exciting beam from 13 to 25 electron volts also has no effect of τ . The construction of the extinguishing curves for the measured lines on a semilogarithmic scale gives 1/2

USSR

MALAKHOV, Yu. I. and FABRIKANT, V. A., Optika i Spektroskopiya, Vol XXXIV, No 4, 1973, pp 645-649

straight lines. The extinguishing section from 0.9 to 0.2 of the total signal amplitude was analyzed. Measurements of the lifetime of the $5p^2D^0$ level

with respect to damping of the intensity of the two lines $\lambda_1 = 4098 \text{ \AA}$ and $\lambda_2 = 4945 \text{ \AA}$ indicate reliability of the results.

"A Method of Increasing Contrast in Recording Optical Images on Strip-Domain Magnetic Tape"

Moscow, Zhurnal Nauchnoy i Prikladnoy Fotografii i Kinematografii, Vol 18, No 3, May/Jun 73, pp 217-218

Abstract: A method is described for increasing image contrast in thermal video recording on strip-domain magnetic tape. Before recording, the magnetic structure of the tape is oriented by an alternating magnetic field with amplitude exceeding the saturation field applied in the plane of the tape. The recording (domain-rotation) field is then applied perpendicular to the orientation of the initial domains. The film is heated by 0.03 μ s neodymium laser pulses. As a result, the domain structure is rotated through an angle proportional to the density of the irradiation energy. Contrast at low intensity is increased by an order of magnitude over conventional recording methods.

"Photography on Magnetic Films of Large Size"

Moscow, Zhurnal nauchnoy i prikladnoy fotografii i kinematografii, No. 6,
Nov/Dec 71, pp 443-445

Abstract: An experimental study to test the possibility of recording an optical image of dimensions $50 \times 50 \text{ mm}^2$ by low intensity light pulses (10^{-7} sec) on a magnetic film with a band domain structure are described. The possibility of applying thin ferromagnetic films with a band domain structure to photograph objects in a pulsed irradiation regime was shown in 1969. Radiant energy scattered from the surface of the object to be photographed is recorded by the magnetic film in the form of the distribution of angles of rotation of the domains in segments of the film with a different degree of irradiation. Nonselectivity of the magnetic films to the radiation wavelength in the thermal recording method makes it possible to record images over a wide spectral range, including the infrared, and the sensitivity over this whole range is comparable

1/2

USSR

YEGOROV, YU. P., et al, Zhurnal nauchnoy i prikladnoy fotografii i kinematografii, No. 6, Nov/Dec 71, pp 443-445

to the sensitivity of photographic films. In the 1969 study recordings were made on an iron-nickel film of dimensions $15 \times 15 \text{ mm}^2$. The light source was a neodymium glass laser in the free generation regime with a pulse length of 1 msec and the image was visualized by a magnetic colloid. For practical purposes it was of great interest to increase the dimensions of the recorded image and to decrease the exposure time. A special technique to keep the composition of the iron-nickel alloy constant over the entire surface of the glass substrate was developed that kept the deviation of the composition in the magnetic film from the composition of the initial alloy less than 0.2%. To reduce exposure time a method of sequential recording of individual sections of the image was applied, the boundaries of which overlapped. The rated heat diffusion from the exposed segments was large in comparison with the repetition rate of the pulses and therefore the cumulative effect on the overlapping sections of the film was eliminated. A photograph is given showing the image on a $50 \times 50 \text{ mm}^2$ film.

"Utilization of Brightness Hysteresis for Recording Images on Ferromagnetic Film"

Moscow, Zhurnal Nauchnoy i Prikladnoy Fotografii i Kinematografii, Vol 17, No 3, 1972, pp 219-220

Abstract: A method for recording images on ferromagnetic film is described, in which the azimuthal angle and the diffraction angle do not change and the image is obtained due to different intensity of the diffracted illumination on illuminated and unilluminated sectors. The new method is based upon the hysteresis nature of the relationship of diffracted-radiation intensity to a normal magnetic field. The hysteresis is manifested in the change of diffraction intensity after the action of a normal field upon a film with band domains. This change of diffraction intensity, brought about by the normal magnetic field, can be "photographed" by heating the film. This forms the basis of the new recording mechanism by means of which the image is fixed on the film in the form of sectors with different diffraction intensities. Pulse laser radiation is used to obtain the image. The sensitivity of this recording 1/2

ABSTRACT. THERMAL EFFECTS ASSOCIATED WITH THE CONSERVATISM OF THE GRAIN BOUNDARIES IN MAGNETIC FILMS WITH BANDED DOMAINS USED TO RECORD OPTICAL IMAGES ARE DISCUSSED THEORETICALLY AND IN THE LIGHT OF PRACTICAL EXPERIENCE. THE MAGNETIC MOMENTS IN THESE FILMS ARE SUBJECT TO SEVERE 'FRICTIONAL' FORCES AND MAY ACCORDINGLY TAKE UP NON EQUILIBRIUM POSITIONS, SUBSEQUENTLY EXPRESSED IN THE FORM OF THERMAL EFFECTS. THE PRACTICAL IMPORTANCE OF THESE AND ANALOGOUS FEATURES IN IMAGE RECORDING ARE CONSIDERED.

"Drive Mechanism for a Ground-Based Antenna System"

USSR Author's Certificate No 282452, filed 30 Oct 68, published 11 Dec 70
(from RZh-Radiotekhnika, No 6, Jun 71, Abstract No 6B109 P)

Translation: This Author's Certificate introduces a drive mechanism for a ground-based antenna system. The mechanism contains a DC force converter, an even number of actuating motors, high-speed and low-speed gear boxes, and crown gears connected to the drive gears. To improve the rigidity of the gear train and simplify the construction of the mechanism, the converter is connected between the common point of the actuating motor armatures and the common point of two power diodes which are connected in series in the same direction in the armature circuits of the same motors. An additional DC source is connected in parallel with these diodes through an auxiliary diode.

"Herbicidal Derivatives of Hydroxylamine
XXXI. Synthesis and Reactions of O,N-Diacylsubstituted N-Arylhydroxylamines"

Moscow, Zhurnal Organicheskoy Khimii, Vol 6, No 2, Feb 70, pp 285-291

Abstract: The authors found that the acylation of N-carboalkyl-N-aryl-hydroxylamines with halophenoxyacyl chlorides is possible when the reaction is carried out in an anhydrous organic solvent -- methylene chloride. The reaction is then accompanied by evolution of gaseous hydrogen chloride. In some cases this reaction becomes hindered by a cross-acetylation reaction; for example with 2,4,5-trichlorophenoxyacetylchloride this becomes even the primary reaction. It goes very well at -20 to -10° in an anhydrous medium. In some cases this cross-acetylation occurs on recrystallization or even on taking the melting point. This reaction is also possible with phenyl-

"Herbicidal Derivatives of Hydroxylamines

XXX. O-Substituted N-halophenoxyacyl-N-alkyl(aryl)hydroxylamines"

Moscow, Zhurnal Organicheskoy Khimii, Vol 6, No 2, Feb 70, pp 281-285

Abstract: O-Acylhydroxylamines were obtained by reacting hydroxylamines with anhydrides of alkylcarboxylic acids in presence of acid catalysts (phosphoric acid or a mixture of phosphoric acid and carboxylic acid anhydrides). The N-methylhydroxylamines react under slightly more drastic reaction conditions than corresponding N-phenyl derivatives. Reaction rate drops with higher molecular weight of the anhydride. O-Carboethoxy-N-haloaryloxyacyl-N-phenyl(methyl)hydroxylamines could be obtained from the reaction of ethylchlorocarbonate and hydroxylamine in an inert solvent at 0 to 20° and in presence of organic bases (pyridine, triethylamine). At room temperature hydroxylamines react with isocyanates to yield O-carbamoyl-N-haloaryloxyacyl-

"Biological Activity of Some Thiazole Derivatives"

Moscow, Khimiko-Farmatsevticheskiy Zhurnal, Vol 7, No 8, Aug 73,
pp 17-20

Abstract: Some thiazole derivatives act as breathing stimulators and as antagonists to morphine, nicotine and to barbiturates. One of the more active agents of this group is 2,4-diamino-5-phenylthiazole hydrochloride (I) -- the so called daptazol. A simplified synthetic method for this compound with slightly improved yield has been developed, and using this method, two new derivatives were synthesized: 2,4-diamino-5-(p-fluorophenyl)thiazole hydrochloride (II), and 2-4-diamino-5-(o-nitrophenyl)thiazole hydrochloride (III). Biological studies were carried out which showed that replacement of the amino groups in the 2 and 4 positions of the thiazole ring by hydroxyl groups resulted in disappearance of the characteristic antimorphine action. The toxicity was increased. Introduction of substituents in the phenyl ring does not change the hypotensive activity of these compounds.

conductivity σ and the pressure in the main stream. In the far wake ($x/d > 150-200$, where d is the diameter of the cylindrical part of the model), this relationship approaches

$$\sigma \sim \frac{1}{\sqrt{x}}$$

Relationships of the electron density drop N_e to the distance along the wake are plotted in terms of x/d . The electron-collision frequencies data were determined taking electron velocity distribution into account.

On the basis of the experimentally obtained initial conditions, changes of the wake temperature, velocity, diameter, and electron concentration are calculated using different models of viscosity. The theoretical and experimental data are compared for a wake sector up to 500 calibers (x/d) in length.

Lobanov, V. F. and Yu. I. Fadeyenko. Calculation of the stresses in an elastic sphere situated in a hypersonic stream. IK: Dinamika sphiernoy stroy, Novosibirsk, no. 7, 1971, 226-232 (RZhMekh, 5/72, #5V285)

An axisymmetric problem is considered, dealing with determination of the stress field originating in a hollow elastic sphere during its presence in a hypersonic stream. The aerodynamic pressure acting upon the sphere is considered to be known and is given in the form of a function that depends upon the angular coordinate in accordance with Newton's law. The inner surface of the sphere is stress-free. The solution is represented in series form using Legendre polynomials. Numerical calculations were conducted on a digital computer for a solid sphere and for a hollow sphere with a Poisson coefficient $m = 2$.

"Selecting the Optimal Ratios of the Amplitudes of Test Signals when Measuring Nonlinear Distortions by the Mutual Modulation Method"

Materialy nauchno-tekhn. konferentsii. Leningr. elektrotekhn. in-t svyazi. Vyp. 3 (Materials of the Scientific and Technical Conference of Leningrad Electrotechnical Communications Institute, Vyp. 3), Leningrad, 1970, pp 252-256 (from RZh-Radiotekhnika, No 8, Aug 70, Abstract No 8A427)

Translation: This article contains an investigation of the effect of variations of the ratios of the amplitudes of a biharmonic test signal on the signal/noise ratio at the display input and also possible correspondence of the results of the measurements to audio perception. It is demonstrated that the accuracy of the measurements and correspondence to audio perception lead to opposite requirements when selecting the amplitude ratios of the test signal. Preliminary recommendations for selecting these ratios are presented.

"Instability of Unidirectional Radiation in a Ring Laser"

Leningrad, Optika i Spektroskopiya, Vol 28, No 4, April 1970,
pp 744-746

Abstract: This article contains a study of the problem of interaction of counter waves in a ring laser. It is demonstrated that in the case of both homogeneous and inhomogeneous types of broadening of the amplification circuit there is always a generation energy range which depends on the difference of the generation frequency and the atomic transition frequency inside which the conditions of unidirectional radiation are unstable with respect to excitation of a counter wave. In the solution of the problems the field inside the resonator is found in the form of traveling waves with amplitudes which slowly vary with time. Both a gas laser and a solid state laser are considered. Explanations are given for the dependence of Γ on the radiation energy, where Γ defines the increment in the weak field ($E \sim \exp \Gamma t$). In the analysis of the solid state laser it is pointed out

"Effect of Air Bypass Aft of the Compressor Into the Jet Nozzle on Indicators of Gas Turbine Jet Engines"

Tr. Kazan. aviats. in-ta (Transactions of the Kazan' Aviation Institute), Vypusk (Issue) 114, 1970, pp 58-76 (from RZh-Mekhanika, No 12, Dec 70, Abstract No 12B482, by M. A. Peshkin)

Translation: The least-squares method, given several simplifying assumptions and hypotheses, was used to evaluate the effect that air bypass aft of the compressor into the afterburner chamber has on the performance indicators of turbojet engines, allowing for the work in the expansion of air and changes in gas enthalpy aft of the turbine. Calculation results are given as Mach number functions of the relative specific fuel consumption and thrust, for a 1% change in the heat release factor and a 1% change in the afterburner chamber pressure due to change in air bypass. Taking the energy of the bypassed air into account markedly improves engine indicators compared with the case when this energy is neglected.

"Influence of the Shape of Icebreaker Contours Upon the Value of Ice Loads"

Leningrad, Ledovyye Kachestva Sudov (Ice Properties of Ships), Gidrometeoizdat, 1973, pp 79-87

Abstract: An analysis is made of the influence of the shape of icebreaker hull contours upon the value of ice loads. Formulas and graphs are presented, which illustrate the relationship of the value of the ice loads upon an icebreaker hull, including the structural components and the cladding, to the angle of inclination of the ribs, the completeness coefficient of the bow area of the waterline, and the length-to-beam ratio of the hull. It is shown that the shape of the hull contours affects to a considerable degree the value of the impact loads originating in the bow of the hull. 4 figures. 1 table. 2 references.

"Generation in the Ultraviolet Band With Frequency Tuning in a Paraterphenyl
Solution Excited by a Flash Bulb"

Moscow, Pis'ma v Zhurnal Eksperimental'noy i Teoreticheskoy Fiziki, Vol 13,
No 11, 5 Jun 71, pp 616-619

Abstract: This article discusses generation with fine tuning in the wavelength
of 330-350 nm in a paraterphenyl solution excited by a flash bulb. One of the
real problems in quantum electronics is the design of a frequency-tunable la-
ser in the ultraviolet band of the spectrum. The authors show the broad pos-
sibilities here of using organic compounds as the active media especially
paraterphenyl, which is found to be the best compound for producing tunable
lasers in the ultraviolet band pumped by flash bulbs. The experimental pro-
cedures are discussed and the results are given in the form of an oscillogram
and a table, which gives the threshold values and the limits of frequency tun-
ing. The low values of the threshold energies for exciting the solutions shown
in this table indicate that this pumping system is also effective for exciting
a large number of other organic compounds. 1 figure, 1 table, bibliography of

EQUATIONS FOR A NONVISCOS LAYER ON A DEFORMABLE CONTOUR

[Article by Yu. M. Zhurav, and Yu. I. Fadeyev, Leningrad; Kiev, Ukraina, Russkaya, No 3, 1971, Izd-vo "Naukova Dumka", pp 46-51]

SPS 55982
15 May 72

The problem of the motion of a deformable body, being a model of an object in hydrodynamics, in a viscous fluid, is extremely complex and cannot be solved at the present time. Assuming that a boundary layer exists during the movement of a deformable body in a fluid of low viscosity, this problem can be divided into two parts: 1) the problem of the movement of a deformable body in a nonviscous fluid (potential problem), 2) the problem of a boundary layer on a deformable body.

During the movement of a hydrodynamic object the induced flow of fluid is three-dimensional and the deformations of its surface have the order of magnitude of the thickness of the body. The correctness of the boundary layer concept for those conditions evidently requires experimental confirmation. However, for deformations of plane or axially symmetric bodies of insignificant magnitude, which is a highly simple schematic representation of the movements of hydrodynamic objects, the boundary layer concept is extremely preferable. This is attributable to satisfaction of the principal requirements of this concept: low viscosity of the fluid (movement with large Reynolds numbers) and the condition of attachment on a wall. Using this schematic representation it is possible to note some

Translation: Compounds having the general formula $RP(O)(OR')OR''$ (I) (R = alkyl, R' and R'' = C_1 to C_6) have acaricidal activity to the stable and sensitive form of vegetation mites. They are prepared by the reaction of $RP(O)(OR')CH_2OH$ (II), with a 5-10-fold excess of $R''OH$. For example, Cl_2 is passed through a solution of 0.03 moles of II ($R=C_9H_{19}$, $R'=C_6H_{13}$) and 0.15 moles of absolute BuOH in 20 ml of CH_2Cl_2 until the appearance of a yellow-green color. It is then concentrated and product I ($R=C_9H_{19}$, $R'=C_6H_{13}$, $R''=Bu$) is obtained, having $n_D^{20} = 1.4435$, $d_4^{20} = 0.9211$, a boiling temperature of 176 to 178° at 1 (?)mm, a yield of about 100%. Other analogous compounds were prepared. R, R' and R''

(from RZh-Khimiya, No 9, May 73, abstract No 9N522P by T. G. Chekareva)

Translation: Compounds of the general formula $RO_3SC_2H_4SC(NH_2)=NH \cdot HA$ (I)
(R = aryl unsubstituted or substituted by Cl, NO_2 , Me; A = Cl or an organic
acid radical) are synthesized by reacting $CH_2=CHSO_3R$ (II) with salts of
thiourea or a mixture of thiourea with inorganic or organic acids. Example.
Solutions of equimolar quantities of II and thiourea hydrochloride in
butanol which are saturated at 60-90°C are heated at 80-90°C for 1 hour,
cooled, and filtered, giving I with a yield of 85-96%. Evaporation of
the mother liquor gives an additional quantity of I. The overall yield of
I is 95-100%. The following compounds of type I (A = Cl) are synthesized
(given are R and the melting point in °C): Ph, 165-6; 4-ClC₆H₄ (Ia),

A Nematocide

USSR Author's Certificate No 296546, filed 17 Nov 69, published 27 Sept 71 (from Referativnyy Zhurnal -- Khimiya, No 10(II), 1972, Abstract No 10N528 by T. A. Belyayeva)

Translation: The nematocidal activity is determined for substances of the general formula $R(OCCH_2CHCl_2)_n$ (I) (R= phenyl or arylene n=1-2), which are obtained by the reaction of halides of aromatic acids with vinyl chloride in the presence of $AlCl_3$. I is used in concentration 0.1, 0.01 and 0.001%.

Some 30-50 mg I is dissolved in a 2-5-fold volume of acetone and mixed with 30-50 mg OP-7. The solution obtained is mixed with water. I (R= C_6H_4 , n=2) (Ia) and I (R= $C_6H_4NO_2$, n=1) (Ib) causes 100% destruction of xalic nematode. I (R and n given): C_6H_4Br , 1 (Ic); $m-C_6H_4NO_2$, 1; $m-C_6H_4Cl$, 1, Ia, b cause 100% destruction of *Aphelenchoides besseyi*, *Aphelenchus avenae*, and *Ditylenchus allii* (concentration 0.1 and 0.01%) cause a 100% destruction of

"Effect of Specific Acaricides Against Susceptible and Resistant
Red Spider Populations"

Moscow, Khimiya v Sel'skom Khozyaystve, Vol 8, No 10 (84), Oct 70,
pp 34-38

Abstract: Experiments were conducted to determine the suitability of some acaricides for killing resistant forms of mites. A susceptible population of Tetranychus urticae Koch taken from Moscow greenhouses was studied as well as three resistant populations produced in the laboratory by keltane, mercaptophos and aramite selection. The acaricides tested were acar, acrex, aramite, binapacryl, eradex, halecron, keltane, mesurol, micazine, milbex, and morestan. The results of these studies show that any resistant red spider population can be destroyed by proper selection of three of four specific acaricides. In the case where mites develop a resistance to organochlorine compounds, substitution or alternate application of acaricides from the keltane-acar-milbex-micazine group is not recommended.

ZIL'BERMINTS, I. V., et al., Khimiya v Sel'skom Khozyaystve, Vol 8, Mo 10 (84), Oct 70, pp 34-38

Substitution and alternate application of acrex, aramite, binapacryl and morestan may be used as well as combination of these chemicals with any from the first group (keltane, acar, milbex and micazine). All compounds tested with the exception of mesurol can be used to combat mites which are resistant to thiophos, mercaptophos, rogor and other similar organophosphorus compounds. Mesurol should not be used simultaneously with organophosphorus compounds to avoid development of resistance to this entire group of pesticides.

"The Acaricide Activity of O-Butyl-S-Methylbenzylidithiophosphonate"

Moscow, Khimiya v Sel'skom Khozyaystve, Vol 11, No 2, 1973, pp 29-31

Abstract: The active ingredient of the acaricide which is also called 228-F was tested on the common spider mite *Tetranychus urticae*. A natural Moscow region mite was used as the sensitive breed, since it had not previously been treated with pesticides and had been cultivated on bean plants in the laboratory for some time. A resistant breed was acquired in the laboratory by treating sensitive mites with methylethylthiophos. Infested leaves were doused with a water-acetone emulsion containing the preparation and a mortality count was taken 72 hours later. To determine contact, intestinal and ovicide action infested leaves were submerged in the solution for 5 seconds. A mortality count was made in 72 hours and unhatched eggs were counted in 4 days. To determine length of action mites were placed on treated bean leaves 3, 5, and 10 days after treatment, then a mortality count was made 72 hours later. The preparation was also used on broad beans against

aphis craccivora Koch, with a mortality count made after 48 hours. 0-butyl-S-methylbenzylidithiophosphonate showed a high contact acaricidity not only with sensitive but also with resistant mites. The acaricide had poor lasting and ovicide results, but did affect the vitality of larvae from treated eggs. Mixture with BI 58 did not lessen toxicity and increased both lasting effects and the time required for the mites to become resistant to the acaricide.
